DIAGNOSTIC MAMMOGRAPHY REPORT

PATIENT INFORMATION:

Patient Name: Eleanor Vance (SYNTHETIC RECORD)

MRN: SYNTH-MAM-99412

Date of Examination: 08/15/2026

Referring Physician: Dr. Marcus Brody, M.D.

Modality: Digital Mammography with 3D Tomosynthesis & Targeted Ultrasound

CLINICAL HISTORY:

58-year-old female presenting with a newly self-palpated, non-tender lump in the left upper outer breast. No family history of breast cancer.

BREAST DENSITY:

The breast tissue is heterogeneously dense (ACR Density Category C), which may obscure small lesions.

MAMMOGRAPHIC FINDINGS:

RIGHT BREAST: Symmetrical fibroglandular architecture. No suspicious masses, architectural distortion, or microcalcifications.

LEFT BREAST: In the upper outer quadrant at 10 o'clock position (6 cm from nipple), there is a 1.6 x 1.4 x 1.5 cm irregular, high-density mass with microlobulated margins. Associated fine pleomorphic microcalcifications are identified within the central component.

TARGETED ULTRASOUND FINDINGS:

Correlating with the mammographic 10 o'clock mass, targeted ultrasound demonstrates a 16 x 14 mm hypoechoic irregular mass with posterior acoustic shadowing and peripheral hypervascularity on color Doppler.

IMPRESSION:

1. Irregular 1.6 cm left breast mass at 10 o'clock with suspicious microcalcifications.

2. BI-RADS Category 4C - High Suspicion for Malignancy.

RECOMMENDATIONS:

Ultrasound-guided core needle biopsy of the left breast 10 o'clock mass is strongly recommended.

Reported by: Dr. Sarah Chen, M.D. (Diagnostic Radiologist)
